## National Register of Historic Places Continuation Sheet

	Rector Road Bridge (amendment, relocated property)
Section 7 Page 5	Denton, Denton County, Texas

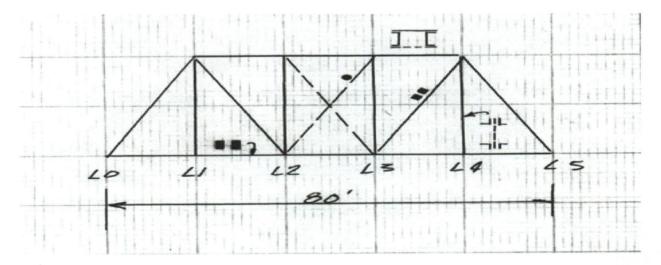

The Rector Road Bridge is a 5-panel, pinned Pratt through-truss with an I-beam approach seated on braced metal-caisson piers and abutments with metal backing. The structural members are light which would facilitate transportation from the source of fabrication to the site and make erection easy with modest equipment. When erected, it had the capacity to carry rural wagon loads, but it currently carries pedestrian traffic.

The 1908 Rector Road Bridge (formerly at Clear Creek, near Sanger) was relocated to John Guyer High School at 7501 Teasley Lane in Denton, Denton County, Texas, in April 2005.

The bridge features 3 spans (including 2 short approach spans) with a primary span length of 80 feet and a total length of 112 feet. The roadway occupies the full width of the 11.9-foot-wide deck. The endposts and top-chord members were fabricated from a pair of channels, with cover plate and battens riveted together. Two pairs of laced angles provide the verticals. A pair of eyebars supply each set of diagonals. An adjustable round rod serves as a counter-brace in one of the more-central panels. The trusses carry braced-A portal struts. Rolled-I floor-beams hang from the lower pins. Adjustable, round-rods provide the lower and the upper lateral braces. The floor-beams carry runs of I-beam stringers which, in turn, support the concrete riding surface.

The bridge was built in 1907-1908 by the Austin Brothers Company of Dallas, Texas. Denton County Commissioners Court Minutes from August 26, 1907 (Book F, 620) recorded the action of awarding the contract to Austin Brothers for the bridge, to be built 2½ miles southeast of the town of Sanger. The cost was \$1,664, with \$1,200 of the cost donated by the citizens of "Sanger and vicinity."

Rector Road Bridge (amendment, relocated property) Denton, Denton County, Texas

#### Statement of Significance

The 1908 Rector Road Bridge (formerly at Clear Creek, near Sanger) relocated to John Guyer High School at 7501 Teasley Lane in Denton, Denton County, Texas, is a 5-panel, pinned Pratt through-truss bridge, and serves as a rare example of its type in Denton County. Because of its structural integrity and riveted pin construction, Rector Road Bridge serves as a rare local example of a Pratt through-truss, and is nominated to the National Register of Historic Places, under Criterion C, in the area of Engineering, at the local level of significance. The property meets Criterion Consideration B because the bridge retains its character-defining features and has been relocated to an appropriate setting.

The citizens of Sanger bore the costs of erecting the Rector Road Bridge, which provided an important passage in the vicinity of Sanger, and facilitated growth and development in north Denton County. On February 19, 1908, the Rector Road Bridge was accepted by the Commissioners and they approved payment to Austin Brothers (Book G, 53-54; page 8-7,8). The total payment was for \$1,894, which included \$230 for a bridge built over the slough near the Rector Road Bridge.

Frank and George Austin were the Atlanta and Dallas agents of the George E. King Bridge Company in the 1890s. They had gotten their start in 1889 when George Austin moved to Dallas as an agent for the George E. King Bridge Co. of Des Moines, IA. The brothers started fabricating and installing steel truss bridges for counties across Texas and Georgia, and gradually expanded their expertise. The company they founded in still in operation today with over 6,000 employees, completing projects in almost every type of civil, commercial and industrial construction. More than 200 Austin Brothers-built, pre-World War II steel truss bridges are still in service on the back roads of Texas.<sup>1</sup> Austin Bridge Co. of Dallas was the only major Texas bridge fabricator prior to the creation of the Texas Highway Department in 1917. After working for the George E. King Bridge Co, of Des Moines, Iowa, the Austin Brothers severed their connection with George E. King Bridge Company and began to make plans to open their own bridge fabricating business. Finally, in 1910, the company purchased property in Dallas and built a small fabrication plant for bridge and building components.<sup>2</sup>

The Pratt truss, patented in 1844 by Thomas and Caleb Pratt, made the vertical members stand in compression and the diagonals in tension, a reversal of the popular construction designs of the day. Although originally constructed in wood and iron, the Pratt was quickly modified for all iron and steel construction, becoming the predominant truss type of the 19<sup>th</sup> Century. By the end of the 1880s, the Pratt design had largely replaced the tubular arch as the standard truss type for short to intermediate spans. By this time, bridge fabricators were manufacturing Pratts in a wide variety of shapes and sizes, principally in short to intermediate span lengths (30 to 150 feet). The straightforward design, considerable strength and east of erection made the Pratt the predominant truss type for American roadways during the late 19<sup>th</sup> and early 20<sup>th</sup> centuries. The Pratt quickly gained acceptance through Texas as the preferred type for short to intermediate spans, reaching its heyday of popularity from 1895 to 1910.<sup>3</sup> Built a few years after the organization of the Texas Highway Department at a time when rural counties opted to build economical truss bridges, the Rector Road Bridge at Clear Creek is a rare local example of what was once a common bridge type in Denton County. The bridge continues to retain a high degree of integrity after relocation in 2005 to John Guyer High School in Denton, Texas. The proposal to move the bridge was approved by the NPS in 2004.

May 21, 2004

Ms. Carol Shull Keeper, National Register of Historic Places National Park Service 1201 Eye Street N.W. 8<sup>th</sup> Floor Washington, DC 20005

RE: Rector Road Bridge, Sanger vicinity, Denton County, Texas (Proposal to Move)

Dear Ms. Shull:

Enclosed is a report outlining a proposal to move a building listed in the National Register of Historic Places (Rector Road Bridge, Sanger vicinity, Denton County, Texas; NR listed January 14, 2004).

This documentation was submitted by Rynell Novak, Ph.D., to fulfill the requirements of the National Historic Preservation Act regarding the relocation of properties listed in the National Register of Historic Places [36 CFR 60.14 (b)]. The bridge is owned by the county and is slated to be replaced by the Texas Department of Transportation (TexDOT) because it is structurally deficient and no longer meets safety standards. The county plans to donate the bridge to the Denton Independent School District (ISD). On January 17, 2004, the Texas State Board of Review approved the moving of the Rector Road Bridge approximately 16.7 miles south, to the site of the John H. Guyer High School (under construction) at 7501 Teasley Road, on the south side of Denton, Texas.

There are no known historic properties (including archeological sites) at the proposed relocation site. Attached is a letter from Nita Thurman, Chair of the Archeology Committee of Denton County Historical Commission, attesting to the lack of such sites. The project is subject to Review under Section 106 of the National Historic Preservation Act. TexDOT will initiate review this summer; discovery of archeological deposits in the project area after work commences would require further review by the Texas Historical Commission.

Please review the enclosed documents and determine if the bridge would retain enough integrity to remain listed in the National Register of Historic Places if it were to be relocated as proposed. If you have any questions or comments, you may contact National Register Coordinator Gregory Smith at (512) 452-4433 or greg.smith@thc.state.tx.us. Thank you very much for your consideration.

Sincerely. F. Lawerence Oaks

Executive Director

## National Register of Historic Places Continuation Sheet

Rector Road Bridge at Clear Creek Sanger vicinity, Denton County, Texas

Section Figure Page 2

### Applicable federal regulations regarding the relocation of properties listed in the NRHP

36 CFR PART 60 (NATIONAL REGISTER OF HISTORIC PLACES) s 60.14 (b) Relocating properties listed in the National Register.

(1) Properties listed in the National Register should be moved only when there is no feasible alternative for preservation. When a property is moved, every effort should be made to reestablish its historic orientation, immediate setting, and general environment.

(2) If it is proposed that a property listed in the National Register be moved and the State Historic Preservation Officer, Federal agency for a property under Federal ownership or control, or person or local government where there is no approved State Historic Preservation Program, wishes the property to remain in the National Register during and after the move, the State Historic Preservation Officer or Federal Preservation Officer having ownership or control or person or local government where there is no approved State Historic Preservation Program, shall submit documentation to NPS prior to the move. The documentation shall discuss:

(i) The reasons for the move;

(ii) The effect on the property's historical integrity;

(iii) The new setting and general environment of the proposed site, including evidence that the proposed site does not possess historical or archeological significance that would be adversely affected by the intrusion of the property; and

(iv) Photographs showing the proposed location.

### Proposal to Relocate the Rector Road Bridge at Clear Creek, Denton County, Texas (NR 2004)

Denton County, Texas, is committed to saving its historic bridges. Through the work of the Denton County Commissioners Court, the Denton County Historical Commission, including Mrs. Mildred Hawk, Chairman of the Historic Bridges and Structures Committee of the DCHC, and other interested citizens, historic truss bridges throughout the county are being saved in place whenever possible, or relocated to other sites within the county where they can be preserved and used for pedestrian and/or equestrian traffic.

Through the efforts of individuals and the actions of the Commissioners Court, interested parties have been identified to receive the bridges. The actions of the Commissioners Court included letters from County Judge Mary Horn to the cities and school districts within the county, asking about their interest in acquiring one of the bridges for their use.

The Denton Independent School District (DISD) is in the process of building a third high school (the John H. Guyer High School) at 7501 Teasley Lane in south Denton. The site has approximately 80 acres of land, including a section through the middle of the site that is an Environmentally Sensitive Area (E.S.A.). In coordination with FEMA, it was determined that the ESA could be spanned by a bridge, and the DISD expressed an interest in relocating a historic bridge to the property. The Rector Road Bridge is of sufficient size to serve as a pedestrian bridge connecting two sections of the campus.

## National Register of Historic Places Continuation Sheet

	Rector Road Bridge at Clear Creek
Section Figure Page 3	Sanger vicinity, Denton County, Texas

When the Rector Road bridge is relocated, it will be less than a mile from the Old Alton Bridge (NR 1988), preserved in place as part of a pedestrian/equestrian trail. The DCHC will likely develop a trail to encourage the public to see the two historic bridges, as well as the site of Old Alton which served as the Denton County seat from 1850-1857.

#### Documentation addressing 36 CFR PART 60.14 (b)

#### (i) Reasons for the move

The Pratt through truss bridge on Rector Road over Clear Creek, just southeast of the town of Sanger, is slated to be removed because it is structurally deficient and no longer meets Texas Department of Transportation (TxDOT) standards. TxDOT will be remove the bridge, and replace it with a bridge meeting current standards for road carrying vehicular traffic. The historic bridge will be able to meet the needs of the school district as a pedestrian bridge.

124

#### (ii) Effect on the property's historical integrity

The entire Pratt through-truss will be moved, and thus the bridge will retain integrity of materials, design, and workmanship, each aspect of integrity being essential for the bridge to retain its significance under Criterion C, in the area of Engineering, as a rare local example of a Pratt through-truss bridge (one of only two remaining in Denton County). The bridge will span a small creek. Mr. Curtis Martin, Director of Construction, reports that the setting will be much like the original location on Rector Road when the bridge is moved. The bridge will serve, however, not as part of a local road, but as a pedestrian walkway for the students to move from the academic area of the property to the athletic areas (see plan).

# (iii) Evidence that the proposed site does not possess historical or archeological significance that would be adversely affected by the intrusion of the property

The new setting carries no historical significance, and it has been determined that relocating the bridge will have no adverse archeological impact on the area. (See Attachment 2)

#### (iv) Photographs showing the proposed location

### **Denton County Historical Commission**

Dec. 5, 2003

Texas Historical Commission Mr. Gregory Smith P.O. Box 12276 Austin, TX 78711-2276

RE: Relocation of Rector Road Bridge

Dear Mr. Smith:

At the request of the Texas Historical Commission and Denton County Historical Commission, I have surveyed the site along Farm-to-Market 2181, also known as Teasley Lane, where one of Denton County's historic iron bridges is being relocated. The bridge is currently at Rector Road and Clear Creek and is being considered for recognition on the National Register of Historic Places.

The new location will be the campus of a new public high school now under construction by the Denton Independent School District. The site where the bridge will be placed is in an environmentally sensitive area that includes a small creek, and possibly a spring, which the bridge will span. There is no known archeological site or historic site within this specific area that would be damaged by placement of the bridge.

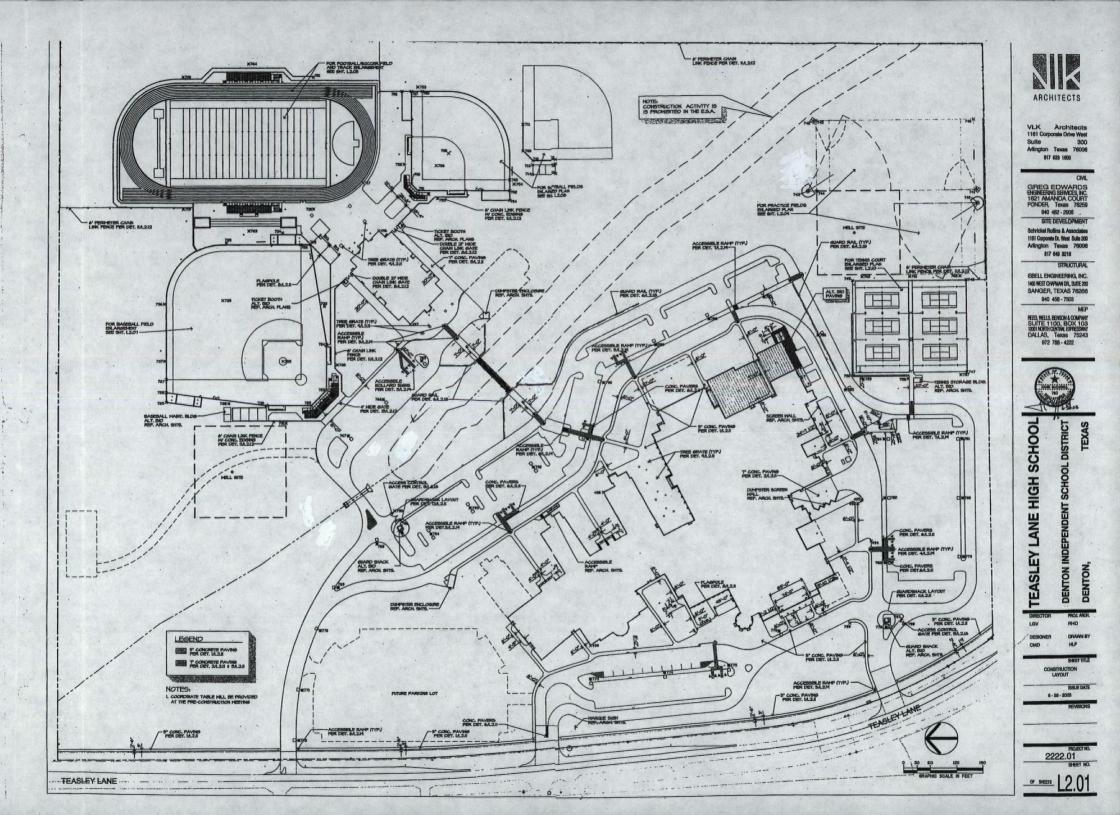

However, because the site is located in a geographical area that was one of the early settlements of Denton County, the creek and/or spring could have been a source of water for early settlers and there is the possibility that artifacts might be turned up when the bridge is installed. We would urge the contractor who installs the bridge to notify the Denton County Historical Commission should any such artifacts be found.

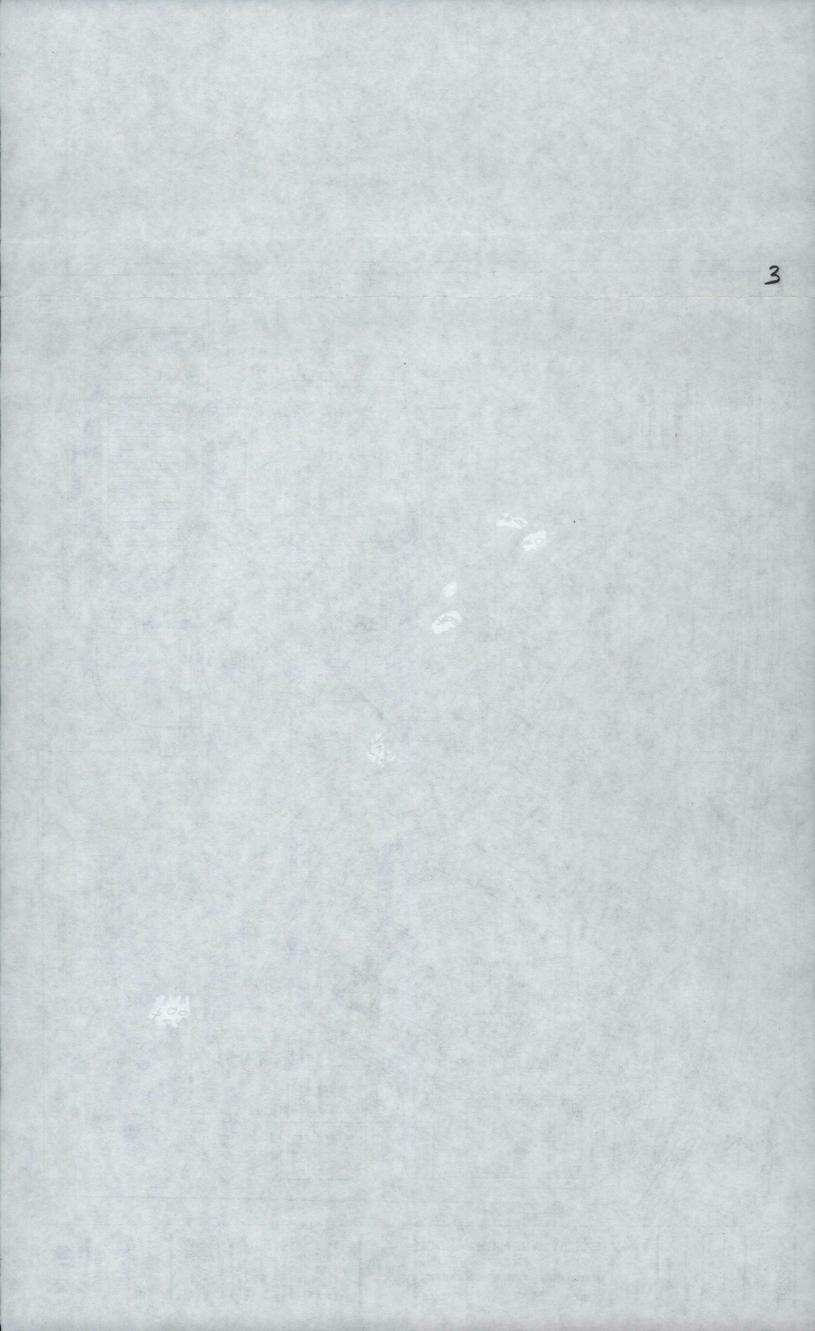

Sincerely,

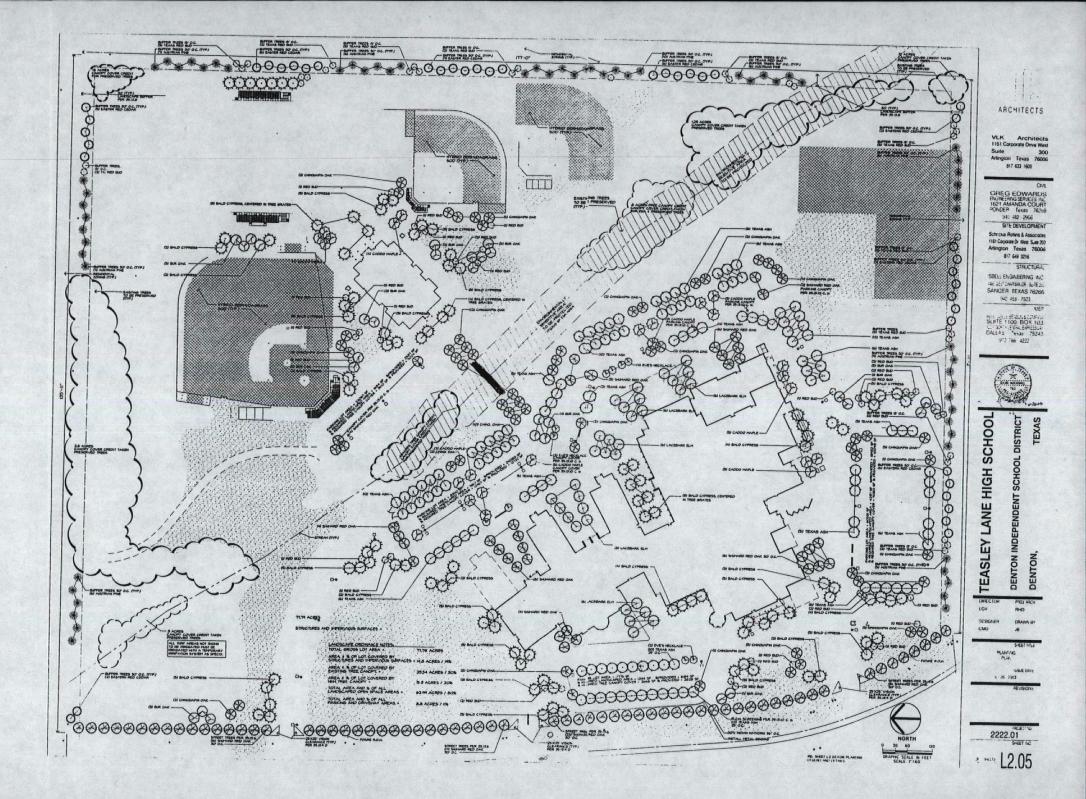

Nita Thurman Chairman, Archeology Committee Denton County Historical Commission

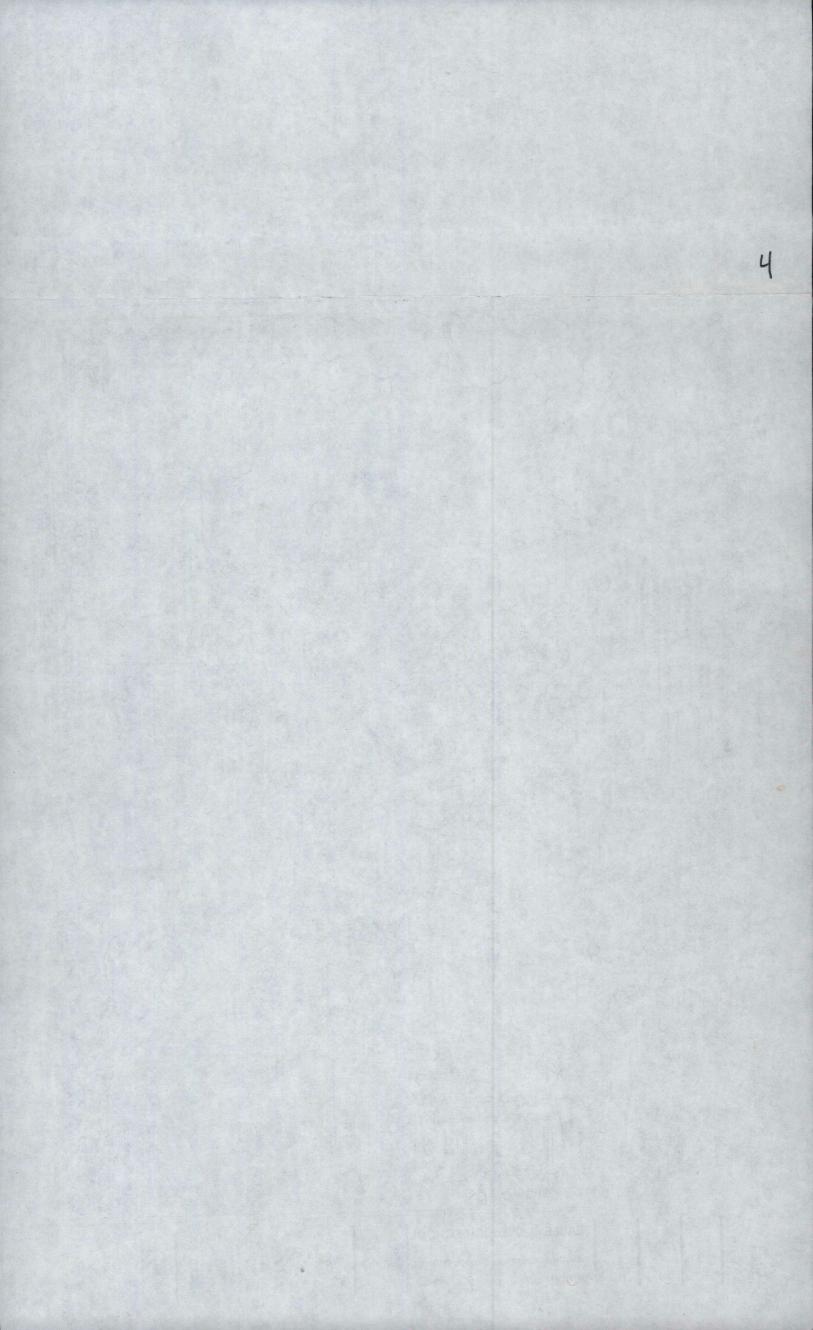

cc: Curtis Martin, Director of Construction, Denton Independent School District Dr. Howard Smith, Chairman, DCHC Mrs. Mildred Hawk, Chairman, Historic Bridges and Structures Committee, DCHC

United States Department of the Interior National Park Service

# National Register of Historic Places Continuation Sheet

	Rector Road Bridge at Clear Creek
Section 7 Page 5	Sanger vicinity, Denton County, Texas

The Rector Road Bridge over Clear Creek is a 5-panel, pinned Pratt through-truss with an I-beam approach seated on braced metal-caisson piers and abutments with metal backing. The structural members are light which would facilitate transportation from the source of fabrication to the site and make erection easy with modest equipment. When erected, it had the capacity to carry rural wagon loads, but it currently carries automobile traffic.

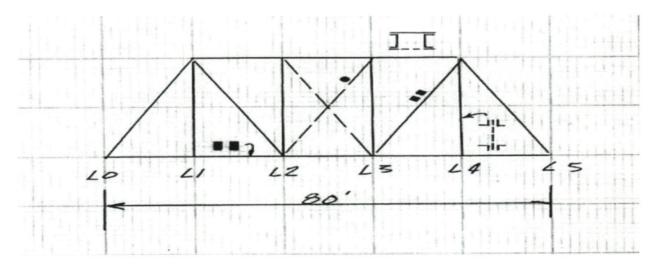

The Rector Road Bridge is located 2.5 miles southeast of the town of Sanger in northern Denton County and .35 miles north of Nicholson Road.

The bridge features 3 spans (including 2 short approach spans), with a primary span length of 80 feet and a total length of 112 feet. The roadway occupies the full width of the 11.9-foot-wide deck. The endposts and top-chord members were fabricated from a pair of channels, with cover plate and battens riveted together. Two pairs of laced angles provide the verticals. A pair of eyebars supply each set of diagonals. An adjustable round rod serves as a counter-brace in one of the more-central panels. The trusses carry braced-A portal struts. Rolled-I floor-beams hang from the lower pins. Adjustable, round-rods provide the lower and the upper lateral braces. The floor-beams carry runs of I-beam stringers which, in turn, support the concrete riding surface.

The Rector Road Bridge over Clear Creek was built in 1907-1908 by the Austin Brothers Company of Dallas, Texas. Denton County Commissioners Court Minutes from August 26, 1907 (Book F, 620) recorded the action of awarding the contract to Austin Brothers for the bridge, to be built 2½ miles southeast of the town of Sanger. The cost was \$1,664, with \$1,200 of the cost donated by the citizens of "Sanger and vicinity."

Although only one lane, the road is still used by postal and school vehicles, and others going or coming from the town of Sanger.

Figure: Cross-section of Rector Road Bridge (James E. M. Stewart, P.E., Churchville, NY). No scale.

Rector Road Bridge at Clear Creek Sanger vicinity, Denton County, Texas

#### Statement of Significance

The 1908 Rector Road Bridge at Clear Creek, near Sanger, Denton County, Texas, is a 5-panel, pinned Pratt through-truss bridge, and serves as a rare example of its type in Denton County. Because of its structural integrity and riveted pin construction, Rector Road Bridge serves as a rare local example of a Pratt through-truss, and is nominated to the National Register of Historic Places, under Criterion C, in the area of Engineering, at the local level of significance. The bridge is one of only two Pratt through-truss bridges still in use on county roads in Denton County.

The citizens of Sanger bore the costs of erecting the Rector Road Bridge, which provided an important passage in the vicinity of Sanger, and facilitated growth and development in north Denton County. On February 19, 1908, the Rector Road Bridge was accepted by the Commissioners and they approved payment to Austin Brothers (Book G, 53-54; page 8-7,8). The total payment was for \$1,894, which included \$230 for a bridge built over the slough near the Rector Road Bridge.

Frank and George Austin were the Atlanta and Dallas agents of the George E. King Bridge Company in the 1890s. They had gotten their start in 1889 when George Austin moved to Dallas as an agent for the George E. King Bridge Co. of Des Moines, IA. The brothers started fabricating and installing steel truss bridges for counties across Texas and Georgia, and gradually expanded their expertise. The company they founded in still in operation today with over 6,000 employees, completing projects in almost every type of civil, commercial and industrial construction. More than 200 Austin Brothers-built, pre-World War II steel truss bridges are still in service on the back roads of Texas.<sup>1</sup>

Austin Bridge Co. of Dallas was the only major Texas bridge fabricator prior to the creation of the Texas Highway Department in 1917. After working for the George E. King Bridge Co., of Des Moines, Iowa, the Austin Brothers severed their connection with George E. King Bridge Company and began to make plans to open their own bridge fabricating business. Finally, in 1910, the company purchased property in Dallas and built a small fabrication plant for bridge and building components.<sup>2</sup>

The Pratt truss, patented in 1844 by Thomas and Caleb Pratt, made the vertical members stand in compression and the diagonals in tension, a reversal of the popular construction designs of the day. Although originally constructed in wood and iron, the Pratt was quickly modified for all iron and steel construction, becoming the predominant truss type of the 19<sup>th</sup> Century. By the end of the 1880s, the Pratt design had largely replaced the tubular arch as the standard truss type for short to intermediate spans. By this time, bridge fabricators were manufacturing Pratts in a wide variety of shapes and sizes, principally in short to intermediate span lengths (30 to 150 feet). The straightforward design, considerable strength and east of erection made the Pratt the predominant truss type for American roadways during the late 19<sup>th</sup> and early 20<sup>th</sup> centuries. The Pratt quickly gained acceptance through Texas as the preferred type for short to intermediate spans, reaching its heyday of popularity from 1895 to 1910.<sup>3</sup> Built a few years after the organization of the Texas Highway Department at a time when rural counties opted to build economical truss bridges, the Rector Road Bridge at Clear Creek is a rare local example of what was once a common bridge type in Denton County. Never modified, it retains a high degree of integrity and continues to serve automobile traffic in the vicinity of Sanger, Texas.
